PROFESSIONAL EXPERIENCE

Senior Python Backend Developer · Allot

May 2025 – Present

Senior Python engineer in ASM (Allot Secure Management) team. Complex cybersecurity backend for ISP traffic and user security management. Responsible for ASM microservices code as well as QA testing, achieving an excellent feedback during 2025 in my performance review. Building and maintaining a highly available security platform that processes ISP traffic at scale. Part of a team of 5 senior developers that evolve and maintain a big microservices system for cybersecurity software as a service. Both Kafka, Redis and MongoDB is used for different kind of data and messages. QA testing is done using Kubernetes and deploying/installing the software in OpenNebula VMs, using ArtiFactory releases and config files as well as Helm charts that define how Kubernetes deploys pods.

Project: ASM (Allot Secure Management) is a cybersecurity SaaS platform sold to ISPs worldwide. It provides per-subscriber traffic analysis, threat detection, and parental-control enforcement at network level, processing millions of events per second across a distributed microservices architecture.

Python Instructor (also teach) · Tajamar

2024 – Present

Delivering advanced Python programming training to professional developers and recommended by them for my soft skills and technical knowledge. Hands-on mentoring on code quality, architecture design, and best practices adoption. Focused on quality code, advanced Python and project-based learning.

Senior Python Developer · Mercedes-Benz (Infoser NT)

May 2024 – Apr 2025

Evolved a large-scale FastAPI microservices system for Azure provisioning. Main testing engineer with 90%+ automated coverage. Achieved 8/9 excellent feedback sessions. Developed two new components in under 5 months. Reduced weekly ticket volume from 12 to 3-4 by automating E2E testing with Behave and pipeline triggers. Cut computing costs 8-10% by implementing RabbitMQ. Implemented granular component deployment using toggles and tag automation in Azure. Recommended as a professional due to results and professionalism.

Project: Large-scale Azure cloud-provisioning platform used by Mercedes-Benz AI and Data teams worldwide. The system automates the lifecycle of hundreds of Azure resources (ADX clusters, storage accounts, networking) via Pulumi IaC services, enabling data scientists to self-serve cloud infrastructure through a FastAPI-backed API layer.

Senior & Lead Python Developer • Frenetic

Nov 2022 – Apr 2024

Led the refactor of a complex calculation monolith with an AI module, growing the team from 4 to 9 engineers. Refactored over 2 million lines of Python technical debt leading a team of senior engineers. Drove the main refactor effort across the full engineering team. Specialized in concurrent code debugging, advanced Python features, and package/framework development.

Project: *Frenetic is a SaaS platform for power magnetics design used by hardware engineers. Its core is a complex calculation engine that models electromagnetic components with an embedded AI module for design optimization. The codebase had accumulated 2M+ lines of legacy Python, which the team systematically refactored into a clean, modular architecture.*

Senior Python Developer & DevOps • BNP Paribas

Jun 2021 – Nov 2022

Built and maintained FastAPI microservices and created Vanish, a DevOps Python framework for the BNP Paribas system. Improved 3 existing services, developed 1 new service, and provided ongoing maintenance for several others. Ansible configuration and security support. Production run-readiness and monitoring setup.

Project: *Internal banking microservices platform supporting BNP Paribas back-office operations. Also developed Vanish, an internal Python DevOps framework that standardized service scaffolding, configuration management, and deployment pipelines across the engineering organisation.*

Python Developer • BBVA • Prosegur (Cipher) • ATM Maggioli

Total of 3 years

Worked across several companies – some as freelance – in finance, cybersecurity, and public administration. Built REST APIs, data pipelines, and backend services. Gained broad experience with PostgreSQL, Docker, CI/CD, and cloud platforms (AWS, Azure).

Project: *Projects spanned finance (BBVA internal risk-data pipelines), cybersecurity (Prosegur/Cipher threat-intelligence backend), and public administration (ATM Maggioli document-management REST services). Each engagement involved full-cycle backend development from requirements through production deployment.*
